

Unique Glass Colors Presents

Details

What are Detail colors? They are high pigment content powders that are mixed with our Medium to the desired consistency and applied over color or directly onto glass with a brush, a writer pen, a stamp, a calligraphy pen or any tool where you want fine detail on your artwork. They can also be mixed with MUD for color tinting. Firing range is 1425F—1550F (except Green and that needs 1480 to mature) and COE 83-96 glass.

Detail Colors come in 1/2 oz. jars in five different colors—Black, White, Brown, Green and Blue.

Here are all five colors used on top of color and also on the clear glass. All the detail colors applied on top of color were applied with Margot's Signature 10/0 Script Liner Brush. A calligraphy pen with a crow quill pen point was used on the clear glass. Colors were thinned to ink consistency for both the brush and the pen. Imagine the possibilities!
